### Text Analysis Interface and Basics

1. **Responses** are shown here. Words that are recognized by the software program are in colored text. *(NOTE: in this example, the software only shows the first 3 lines of text)*

2. The **“dictionary”** of terms that the software recognizes. If the term has a bucket icon next to it, it means that term is included in a category (see #3 above). The column “Docs” show how many responses contain this term.

3. Categories (denoted by a bucket icon) are collections of terms, phrases and simple rules that comprise a single homogenous idea or concept. The category “exercise” is expanded to show the terms included in it. The column “Docs” shows how many responses are placed into each category.

4. Each response is placed into one or more categories, which are also listed here. Rarely, a response may be “uncategorized” if it contains no meaningful or machine-recognizable text. -- These categories may be used as variables in further analyses. A response can be present (1) or absent (0) in any given category.
